

<http://enterobase.warwick.ac.uk/>

Enterobase currently contains **1,634,624** bacterial strains

Salmonella

Total strains: 746,621

Assemblies in progress: 90

Schemes: rMLST, Achtman 7 Gene MLST, cgMLST V2 + HierCC V1, wgMLST

Escherichia/Shigella

Total strains: 427,400

Assemblies in progress: 21

Schemes: rMLST, wgMLST, Achtman 7 Gene MLST, cgMLST V1 + HierCC V1

Mycobacterium tuberculosis

Total strains: 210,685

Schemes: cgMLST + HierCC, cgMLST V2 + HierCC

Streptococcus

Total strains: 165,345

Assemblies in progress: 14

Schemes: cgMLSTv1

Clostridioides

Total strains: 33,279

Assemblies in progress: 0

Schemes: wgMLST, rMLST, cgMLST V1 + HierCC V1

Vibrio

Total strains: 23,609

Assemblies in progress: 0

Schemes: rMLST, Vibrio cgMLST + HierCC

Helicobacter

Total strains: 12,453

Assemblies in progress: 0

Schemes: rMLST

Yersinia

Total strains: 12,420

Assemblies in progress: 1

Schemes: rMLST, wgMLST, Achtman 7 Gene, McNally 7 Gene, cgMLST V1 + HierCC V1

Moraxella

Total strains: 2,812

Assemblies in progress: 0

Schemes: rMLST, Achtman 7 Gene

About EnteroBase

Frequently Asked Questions

HierCC equivalents

- Illumina raw reads (FastQ files) need to be uploaded
- Complete a metadata sheet & link to raw read files
- Upload
- Data are automatically analysed using various bioinformatics tools & reported in experimental data outputs

Bacterial Isolate Genome Sequence Database (BIGSdb)

Gene-by-gene population annotation and analysis

Written by Keith Jolley , © 2010-2025 University of Oxford

Jolley & Maiden 2010, *BMC Bioinformatics* **11**:595  [cited by 

BIGSdb is software designed to store and analyse sequence data for bacterial isolates. Any number of sequences can be linked to isolate records - these can be small contigs assembled from dideoxy sequencing through to whole genomes (complete or multiple contigs generated from parallel sequencing technologies such as Illumina).

BIGSdb extends the principle of MLST to genomic data, where large numbers of loci can be defined, with alleles assigned by reference to sequence definition databases (which can also be set up with BIGSdb). Loci can also be grouped into schemes so that types can be defined by combinations of allelic profiles, a concept analagous to MLST.

Bacterial Isolate Genome Sequence Database (BIGSdb)

Gene-by-gene population annotation and analysis

BIGSdb is software designed to store and analyse sequence data for bacterial isolates. Any number of sequences can be linked to isolate records - these can be small contigs assembled from dideoxy sequencing through to whole genomes (complete or multiple contigs generated from parallel sequencing technologies such as Illumina or Oxford Nanopore).

BIGSdb extends the principle of MLST to genomic data, where large numbers of loci can be defined, with alleles assigned by reference to sequence definition databases (which can also be set up with BIGSdb). Loci can also be grouped into schemes so that types can be defined by combinations of allelic profiles, a concept analogous to MLST.

The software has been released under the GNU General Public Licence version 3. The latest version of this documentation can be found at <https://bigsdbs.readthedocs.org/>.

Bacterial Isolate Genome Sequence Database (BIGSdb)

Gene-by-gene population annotation and analysis

Written by Keith Jolley , © 2010-2025 University of Oxford

Jolley & Maiden 2010, *BMC Bioinformatics* **11**:595  [cited by 

BIGSdb is software designed to store and analyse sequence data for bacterial isolates. It is linked to isolate records - these can be small contigs assembled from dideoxy sequencing or complete or multiple contigs generated from parallel sequencing technologies such as NGS.

BIGSdb extends the principle of MLST to genomic data, where large numbers of loci are compared by reference to sequence definition databases (which can also be set up with BIGSdb) to define schemes so that types can be defined by combinations of allelic profiles, a concept known as gene-by-gene population annotation.

BIGSdb-Lm provides access to genotypic data for *Listeria* isolates based on Multilocus Sequence Typing (MLST), core genome MLST (cgMLST) and other schemes. The database is now also accessible through RESTful API (see below). **Please cite *Nature Microbiology* (2016) 2:16185!** See [references](#) for more details.

listeriaMLST@pasteur.fr

Data access policy note: since January 1st, 2025, registration and authentication are mandatory to access all data curated after this date, either via the web interface or via the application programming interface ([API authentication help link](#)). Please [contact us](#) if you have any questions.

Alleles & profiles database

The typing database contains nomenclature - allele definitions that provide an identifier for every unique allele sequence, and MLST profiles that index each unique combination of alleles with a sequence type (ST).

Isolates & genomes database

The isolate database consists of isolate records containing provenance and phenotype information linked to molecular typing information. These records may also include genome assemblies.

Data submission

[Data Submission Guidelines](#)

[Quality criteria for whole genome assembly](#)

[Metadata fields description](#)

[Template for Listeria isolates](#)

We'd appreciate if you could recognize our efforts in the acknowledgments section of your publications:

We thank the Institut Pasteur teams for the curation and maintenance of BIGSdb-Pasteur databases at <https://bigsddb.pasteur.fr/>.

Curators access

Data Curation is performed on a voluntary basis and is based on a community effort.

[Sequences & profiles](#)

[Isolates](#)

Listeria PasteurMLST database

The Listeria PasteurMLST database contains data for a collection of isolates that represent the total known diversity of Listeria species. For every allelic profile in the profiles/sequence definition database there is at least one corresponding isolate deposited here. Any isolate may be submitted to this database and consequently it should be noted that it does not represent a population sample.

Note: You currently have 42 records embargoed. 9 of these will be made public on 2026-07-16.

Record versions: current; Record creation: all time

INFORMATION

Manage submissions

Submit new isolates with genome assemblies

Paste in your isolates for addition to the database using the template available below.

- Optionally enter aliases (alternative names) for your isolates as a semi-colon (;)-separated list.
- Optionally enter references for your isolates as a semi-colon (;)-separated list of PubMed ids.
- You can also upload additional allele fields along with the other isolate data - simply create a new column with the extracted directly from the genome.
- Enter the name of the assembly contig FASTA file in the assembly_filename field and upload this file as supporting file. **Upload is limited to 500 files.**
- Enter the name of the sequence method used in the sequence_method field (allowed values: 454, Illumina, Illumina SOLiD, other, unknown)

Templates

Check the [description of database fields](#) for help with filling in the template.

Please paste in tab-delimited text (include a field header as the first line)

Action

SUBMIT

- Assembled sequencing data files (.Fasta format) need to be uploaded
- Complete a metadata sheet & link to assembled data files
- Upload
- Data are automatically analysed using various bioinformatics tools

Pathogen Detection **BETA**

NCBI Pathogen Detection integrates [bacterial and fungal pathogen genomic sequences](#) from numerous ongoing surveillance and research efforts whose sources include food, environmental sources such as water or production facilities, and patient samples. Foodborne, hospital-acquired, and other clinically infectious pathogens are included.

The system provides two major automated real-time analyses: 1) it quickly clusters related pathogen genome sequences to identify potential transmission chains, helping public health scientists investigate disease outbreaks, and 2) as part of the National Database of Antibiotic Resistant Organisms (NDARO), NCBI screens genomic sequences using AMRFinderPlus to identify the antimicrobial resistance, stress response, and virulence genes found in bacterial genomic sequences, which enables scientists to track the spread of resistance genes and to understand the relationships among antimicrobial resistance, stress response, and virulence.
